High Streamflow Advisory: South Interior and Okanagan-Kettle

Issued: 04June2012 3:45PM

The BC River Forecast Centre is issuing a **High Streamflow Advisory** for rivers in the **Interior** including:

- **South Interior**
- **Okanagan-Kettle**

A large-scale upper low pressure system is currently developing across the western United States and contains significant moisture. This system is expected to deliver significant rain over Monday evening and through Tuesday for the Okanagan-Kettle and South Interior region. Forecasted rainfall amounts over the next 2 to 3 days are in the 30 to 70 mm range, with the potential for higher amounts locally.

Rivers in the South Interior and Okanagan-Kettle are expected to begin rising early on Tuesday and persist rising into Wednesday and potentially Thursday. The timing and amount of rise in rivers across the region will depend on the amount of rain that falls. At this stage there is still uncertainty over the overall amounts of rain that will fall, and the locations which will experience the heaviest rainfall. As a result, river forecasts are expected to change over the next several days as weather modelling and weather observations continue to track the progress of this weather event.

The River Forecast Centre will continue to monitor conditions and will provide updates as conditions warrant.

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
