BC River Forecast Centre

ENDED - High Streamflow Advisory: North Shore-Howe Sound

Issued: 01November2012 9:45 AM

The BC River Forecast Centre is **ending** a **High Streamflow Advisory** for:

- North Shore Mountains (including Seymour, Lynn, Capilano, Coquitlam and surrounding small streams)
- Howe Sound

Areas of the North Shore, Howe Sound and Greater Vancouver received rainfall amounts of 50 to 100 mm over the past 36 hours. River levels have reached their peak levels in response to this rainfall, and most gauged rivers in the region approached 2-year flow levels. Rainfall has now eased and river levels are receding. No additional rises are expected at this time.

The River Forecast Centre will continue to monitor conditions and will provide updates as conditions warrant.

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
