BC River Forecast Centre

High Streamflow Advisory: South Interior

Issued: 8 May 2013 11:15 AM

The BC River Forecast Centre is **issuing a High Streamflow Advisory** for:

- Okanagan (including Mission Creek and other small watersheds)
- Similkameen (including the Tulameen River, the mainstem of the Similkameen, and tributaries)
- Boundary (including the West Kettle, Kettle, and Granby Rivers and tributaries)
- Kootenay (including the Salmo, Moyie, and other small watersheds)
- Thompson Region (including the Salmon River near Falkland, Coldwater River, Chase Creek, and other small watersheds)

Several days of high temperatures has led to rapid melt of this season's snow pack. River levels have been rising quickly in response to this melt. Current river levels are below levels of concern, however the weather forecast from Environment Canada is for steady increases in temperatures in the South Interior through Friday.

River levels are expected to continue to increase through the remainder of the week, reaching the highest levels late on Friday or into Saturday.

With temperatures forecasted to ease slightly over the weekend, river levels may ease slightly into Sunday.

The River Forecast Centre will continue to monitor conditions and will provide updates as conditions warrant.

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
