UPDATE: Flood Warning – Sumas (MAINTAINED)

Issued: 10:30 AM December 13, 2025

The River Forecast Centre is **maintaining** a Flood Warning for:

- Sumas River

Weather Synopsis:

Rainfall has eased over the past two days, allowing for a reprieve on additional input to runoff in the Sumas basin. A series of storm events is expected starting later Saturday evening and extending through next week. Current weather forecasts have rainfall building on Sunday and into Monday, with heavy rainfall possible over Monday. Environment and Climate Change Canada have issued a Special Weather Statement for the Fraser Valley, highlighting concerns for the weather pattern and increased vulnerability on the landscape to severe weather given recent rainfall, ground saturation and current flooding.

River Conditions:

Flows on the Nooksack River peaked through Everson on Thursday afternoon. River levels have since been dropping, and overflow from the Nooksack River into the Sumas River drainage ceased late on Thursday night.

Flows on the Sumas River near Huntingdon (Water Survey of Canada Gauge 08MH029) reached peak levels on Thursday afternoon. Levels have been slowly receding, and as of Saturday morning (9:30AM) have dropped approximately 25cm from peak level. Continued slow declines in flood level are expected through Saturday and Sunday.

areas. Forecasts from the Northwest River Forecast Center for the Nooksack River are not currently indicating a potential for another overflow event into the Sumas River. Local inflow into the Sumas River is expected to increase from Sunday through Tuesday, with the potential for slowing of floodwater retreat, and the potential for additional rises in levels along the Sumas River. Ground saturation across the watershed can lead to increased surface runoff and increased vulnerability of the landscape to this rainfall event.

Heavy rain and high streamflow bring increased risk for unstable banks, river erosion, submerged roads, swift water hazards, flooding and landslides. Stay clear of the banks of swift

Ministry of Water, Land and Resource Stewardship

running rivers and never drive across flooded roads, bridges or river crossings. At this time of year leaves can clog storm drains and impact urban drainage. Keep storm drains clear.

Review personal flood emergency plans and be prepared to implement if needed. Information on local flood response, including evacuation alerts and orders, is available from local governments and First Nations.

The [River Forecast Centre](#) continues to monitor the conditions and will provide updates as conditions warrant.

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Fast-flowing bodies of water increase risk to life safety. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
