High Streamflow Advisory – Upper Columbia, East Kootenay, West Kootenay Issued: 11:00AM June 2, 2021

The River Forecast Centre is **issuing** a **High Streamflow Advisory** for:

- **Upper Columbia**
- **East Kootenay**
- **West Kootenay**

A strong high-pressure ridge has developed over British Columbia resulting in the hottest temperatures of the season. The Upper Columbia, East Kootenay and West Kootenay accumulated average snowpack during the winter season. The recent heat is rapidly melting remaining snow at higher elevations and many watersheds are forecast to reach 2 to 5-year return period flows. Currently, there is no imminent threat of major flooding. However, the hot weather is producing the highest flows of the season for the regions and could make the region vulnerable if a heavy rainfall event were to occur after the heat.

Please refer to the CLEVER forecast page (http://bcrfc.env.gov.bc.ca/freshet/map_clever.html) for details.

The public is advised to stay clear of the fast-flowing rivers and potentially unstable riverbanks during the high-streamflow period.

The [River Forecast Centre](#) continues to monitor the conditions and will provide updates as conditions warrant.

BC River Forecast Centre

Ministry of Forests, Lands, Natural Resource Operations and Rural Development

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
