Downgraded – High Streamflow Advisory: Stikine River, Tuya River

Issued: 12:50PM June 4, 2021

The River Forecast Centre is **downgrading** the **Flood Warning** to a **High Streamflow Advisory** for:

- **Stikine River and tributaries**
- **Tuya River**

Responding to the high temperatures in this region early this week, the Tuya River near Telegraph Creek (08CD001) has peaked at 690 m³/s, a flow slightly below the 50-year return period, yesterday, and dropped to a flow between the 5- and 10-year return periods now. The Stikine River at Telegraph Creek (08CE001) has peaked at 2,590 m³/s, a flow between the 2-year and 5-year return periods, early this morning. Based on the current hydrological modeling, the Tuya River is expected to drop further into the weekend, and the Stikine is also expected to drop slowly this weekend. Minor rises in the river levels could be possible. Please refer to the CLEVER forecast page (http://bcRFC.env.gov.bc.ca/freshet/map_clever.html) for details.

The public is advised to stay clear of the fast-flowing rivers and potentially unstable riverbanks during the high-streamflow period.

The [River Forecast Centre](#) continues to monitor the conditions and will provide updates as conditions warrant.

BC River Forecast Centre

Ministry of Forests, Lands, Natural Resource Operations and Rural Development

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
